

Cannathera Access, Source and Cost Handoff

Prepared from the source repository on 5 August 2026. Secrets are intentionally excluded.

1. Complete source access

The complete application source is the repository rooted at `cannathera-saas/`.

Area	Location
Web application	<code>frontend/</code>
API and business logic	<code>backend/src/</code>
Database schema and migrations	<code>backend/prisma/</code>
Translations	<code>frontend/messages/</code>
Architecture documentation	<code>cannathera_saas_documentation.md</code> and <code>docs/</code>

Do not distribute `backend/.env`, database exports, password hashes, API keys, or live patient data with a source archive. Transfer those through a password manager and rotate them after handoff.

2. Verified demo accounts found in source

Portal	Email	Demo password	Source
Enterprise	<code>enterprise@example.com</code>	<code>testpass123</code>	<code>backend/prisma/seed-enterprise.ts</code>
Pharmacy	<code>apotheke@example.com</code>	<code>testpass123</code>	<code>backend/prisma/seed-pharmacy.ts</code>

Not verified in source: a physician demo password and a patient demo password. These should be reset through the application rather than guessed or copied from password hashes.

3. External account ownership checklist

Service	Application configuration	What must be handed over securely
PostgreSQL	<code>DATABASE_URL</code> is configured locally	Provider account, project/database name, billing owner, backup policy, recovery codes
SMTP / email	SMTP host, user and password variables are configured	Mailbox/provider login, billing owner, DNS records, recovery codes

Zoom	Account ID, client ID and client secret variables are configured	Zoom Marketplace owner, app ownership transfer, billing plan, recovery codes
Stripe	No Stripe keys are configured in the inspected environment	Stripe account owner, team invitation, live/test mode access, webhook endpoints, bank/payout ownership, recovery codes
OpenAI	No OpenAI API key is configured in the inspected environment	Organization/project owner, project key rotation, budget and usage limits
Hosting / DNS	No deploy manifest or verified provider account is present	Cloud/Vercel/Railway account, domain registrar, DNS provider, deployment project, billing owner, recovery codes

4. Server and operating-cost overview

The repository alone does not contain invoices or a verified production topology, so an exact monthly total cannot be responsibly stated.

Cost centre	Billing driver	Evidence currently available
Frontend hosting	Build minutes, bandwidth, server rendering	No provider/project verified
Backend compute	Always-on instance size, CPU/RAM, outbound traffic	Node/NestJS API; no deployed instance verified
PostgreSQL	Compute, storage, backups, data transfer	Database connection exists; provider and plan not identified
File/PDF storage	Stored reports, backups and download traffic	Local protected storage in code; production object storage not verified
Email	Mailbox/SMTP plan and message volume	SMTP configured; contract price absent
Zoom	Host licences and meeting usage	OAuth integration configured; contract price absent
Stripe	Transaction and payment-method fees	Code integration exists; live account not configured here
OpenAI	Tokens used for AI report summaries	Integration exists; key/budget not configured here
Domain/DNS	Annual domain renewal and optional DNS services	No registrar invoice available

Monitoring/backups	Retention, logs, alerts, snapshots	No paid monitoring provider verified
--------------------	------------------------------------	--------------------------------------

Required for an exact total: the latest invoice or billing-page export from every provider above. Monthly total = fixed subscriptions + metered infrastructure + payment fees + AI usage + annual costs divided by 12 + applicable VAT.

5. Security handoff rule

Invite the founder as owner/admin in each external service, transfer billing ownership, place recovery codes in a shared password-manager vault, rotate all application secrets, and then revoke the previous developer’s access. A PDF must never be the system of record for live passwords or secret keys.
